

## Truss Jibs

Truss Jib - A truss jib is utilized in order to lift and position trusses. It is actually an extended jib additional part that is outfitted along with a pyramid or triangular shaped frame. Usually, truss jibs are mounted on machines like a skid steer loader, a compact telehandler or a forklift making use of a quick-coupler accessory.

Older kind cranes that have deep triangular truss jibs are most often assemble and fastened using bolts and rivets into standard open structural shapes. There are rarely any welds on these style jibs. Each and every bolted or riveted joint is prone to rust and therefore needs regular maintenance and inspection.

Truss jibs are made with a back-to-back arrangement of lacing members separated by the width of the flange thickness of an additional structural member. This particular design causes narrow separation among the smooth surfaces of the lacings. There is little room and limited access to preserve and clean them against rusting. Numerous rivets loosen and rust in their bores and should be changed.
